

# **Assignment Solutions | Sliding window | Week 12**

1. Given an array of integers arr and two integers k and threshold, return the number of subarrays of size k and average greater than or equal to threshold. [Leetcode 1343]

# Example 1:

**Input:** arr = [2,2,2,2,5,5,5,8], k = 3, threshold = 4

Output: 3

**Explanation:** Sub-arrays [2,5,5],[5,5,5] and [5,5,8] have averages 4, 5 and 6 respectively. All

other sub-arrays of size 3 have averages less than 4 (the threshold).

Example 2:

**Input:** arr = [11,13,17,23,29,31,7,5,2,3], k = 3, threshold = 5

Output: 6

**Explanation:** The first 6 sub-arrays of size 3 have averages greater than 5. Note that averages are

not integers.

Solution:

```
class Solution {
public:
    int numOfSubarrays(vector<int>& a, int k, int th) {
        int n = a.size();

        int sum = 0;
        int avg = 0;
        int ans = 0;
        for(int i=0;i<k;i++)sum += a[i];
        avg = sum/k;
        if(avg >= th)ans++;

        int i=k;

        while(i < n){
            sum -= a[i-k];
            sum += a[i];
            avg = sum/k;
            if(avg >= th)ans++;
            i++;
        }
}
```

- 2. The **score** of an array is defined as the **product** of its sum and its length.
- For example, the score of [1, 2, 3, 4, 5] is (1 + 2 + 3 + 4 + 5) \* 5 = 75.

Given a positive integer array nums and an integer k, return the **number of non-empty** subarrays of nums whose score is **strictly less** than k.

A subarray is a contiguous sequence of elements within an array. [Leetcode 2302]

### Example 1:

**Input:** nums = [2,1,4,3,5], k = 10

# Output: 6

#### **Explanation:**

The 6 subarrays having scores less than 10 are:

- [2] with score 2 \* 1 = 2.
- [1] with score 1 \* 1 = 1.
- [4] with score 4 \* 1 = 4.
- [3] with score 3 \* 1 = 3.
- [5] with score 5 \* 1 = 5.
- $\circ$  [2,1] with score (2 + 1) \* 2 = 6.

Note that subarrays such as [1,4] and [4,3,5] are not considered because their scores are 10 and 36 respectively, while we need scores strictly less than 10.

```
Example 2:
```

**Input:** nums = [1,1,1], k = 5

Output: 5

#### **Explanation:**

Every subarray except [1,1,1] has a score less than 5.

[1,1,1] has a score (1+1+1)\*3=9, which is greater than 5.

Thus, there are 5 subarrays having scores less than 5.

#### Solution:

3. Given an array of integers nums and an integer k. A continuous subarray is called **nice** if there are k odd numbers on it. [Leetcode 1248]

Return the number of **nice** sub-arrays.

# Example 1:

**Input:** nums = [1,1,2,1,1], k = 3

Output: 2

**Explanation:** The only sub-arrays with 3 odd numbers are [1,1,2,1] and [1,2,1,1].

Example 2:

**Input:** nums = [2,4,6], k = 1

Output: 0

**Explanation:** There is no odd numbers in the array.

Example 3:

**Input:** nums = [2,2,2,1,2,2,1,2,2,2], k = 2

# Output: 16

## Solution:

```
class Solution {
public:
    int numberOfSubarrays(vector<int>& a, int k) {
        int n = a.size();
        int i=0,j=0,cnt=0,ans=0,odd=0;

        while(j<n){
            if(a[j]%2!=0){
                 cnt = 0;
                 odd++;
            }
        while(i<=j and odd == k){
                 cnt++;
                 if(a[i+]%2 != 0)odd--;
            }
            ans += cnt;
            j++;
        }
        return ans;
}
</pre>
```
